

Iwaki Emotron Power Monitor

Protect your pump from no flow conditions

The Iwaki Emotron Power Monitor is ideal for protecting your pump from dry-running, cavitation and dead head conditions. The unit detects over as well as under load conditions sending a warning signal and/or shutting down the pump.

Emotron M20 shaft power monitor protects your pump and process against damage and downtime. Early warnings and trips allow preventative action to be taken.

Its high accuracy scalable design also protects pumps from wear during low flow, closed valve, or blocked pipe conditions. Much less expensive than sensors and meters, the Iwaki Emotron Power Monitor does not require periodic maintenance or cleaning like other monitoring technology.
